To assist students in navigating this educational activity successfully, this comprehensive answer key provides detailed explanations, correct responses, and helpful insights. Whether you're a student reviewing your work or a teacher designing assessments, this guide ensures clarity and accuracy in understanding wave phenomena.

Introduction to Waves

Waves are disturbances that transfer energy from one place to another without the transfer of matter. They are fundamental in various natural and technological processes, including sound transmission, light propagation, and seismic activities. The WebQuest encourages learners to investigate different wave characteristics, types, and behaviors.

Types of Waves

Waves are primarily classified into two categories based on their motion and medium interaction:

Mechanical Waves

Mechanical waves require a medium (solid, liquid, or gas) to travel through. They cannot move through a vacuum. Examples include sound waves, water waves, and seismic waves.

Electromagnetic Waves

Electromagnetic waves do not need a medium and can travel through the vacuum of space. They include visible light, radio waves, X-rays, and microwaves.

Wave Properties and Characteristics

Understanding the properties of waves is crucial to grasp their behavior. The WebQuest covers key properties such as:

Amplitude

- Definition: The maximum displacement of particles from their rest position.
- Significance: Determines the wave's energy; larger amplitude means higher energy.

Wavelength

- Definition: The distance between two consecutive crests or troughs.
- Significance: Influences the wave's frequency and energy.

Frequency

- Definition: The number of wave cycles that pass a point per second (measured in Hertz).
- Relationship: Higher frequency means shorter wavelength.

Speed

- Definition: How fast a wave propagates through a medium.
- Formula: $v = f \times \lambda$ (speed = frequency $\times$ wavelength).

Wave Behavior and Interactions

The WebQuest emphasizes different behaviors exhibited by waves:

Reflection

When a wave bounces off a surface it cannot pass through. Key points:

- The angle of incidence equals the angle of reflection.
- Example: Echoes in a canyon.

Refraction

Bending of waves as they pass from one medium to another.

- Causes: Change in wave speed.
- Example: Light bending when entering water.

Diffraction

Waves spreading out after passing through a narrow opening or around obstacles.

- More pronounced with longer wavelengths.
- Example: Sound waves bending around a corner.

Interference

When two or more waves overlap, they interfere:

- Constructive interference: amplitudes add up, creating a larger wave.
- Destructive interference: amplitudes cancel out, resulting in a smaller or zero wave.
